Module "Driving quality"

01

To start working with the new module, you need to create violation templates for unit. The user can create individual violations with a specific set of settings and parameters: acceleration, braking, harsh driving, speeding, acceleration when cornering and others.

The system also has the ability to create violations using ready-made templates, the choice of which depends on the type of vehicle: passenger car, truck, bus.

02

After setting up violation templates, the user can analyze unit round for the presence of created violations. To do this, we have prepared a new window - "Driving Quality". In it, you can view the rating of violators, the list of violations, and a summary of violations on rounds.

03

The user can quickly build a summary report on unit violations with a visual graph in the "Monitoring" section.

Driving quality control solution!
